

DG T-4 TRANSMITTER

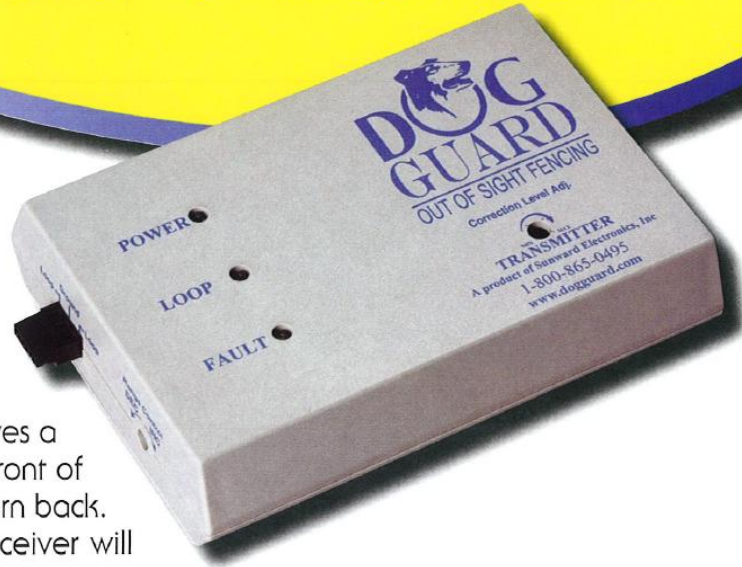

FEATURES:

The T-4 transmitter features **user friendly lights and audible sounds** to let you know that the transmitter is working properly and when there is a problem with the signal field.

When the T-4 transmitter is set in the encoded mode, an **ID code** makes the system **immune to interference** from stray signals and provides "**DUAL ZONES**", in the signal field. The dual zone establishes two signal fields. In the first signal field the pet receives a warning level stimulus that has been preset on the front of the T-4 transmitter. Its purpose is to warn the pet to turn back. Should the pet enter the second signal field, the receiver will automatically increase to a stronger stimulus.

The T-4 transmitter **has two frequency settings** to accommodate side by side installations and can be used on any size yard up to 50 acres.

The T-4 transmitter has a **LIFE TIME warranty** provided it is not damaged or abused and is installed with a surge protector approved by Dog Guard.

The **GREEN POWER LIGHT** is on all the time when the system is powered.

The **RED LOOP LIGHT** is on when the loop is intact. If there is a line break, the light will go off and an audible alarm will sound from inside the T-4 transmitter.

The **YELLOW FAULT LIGHT** comes on if the T-4 transmitter takes a power surge or lightning hit and an audible alarm will sound from inside the T-4 transmitter.

The **CORRECTION LEVEL ADJUSTMENT** works only in the encoded mode. There are **32 LEVELS OF STIMULATION TO CHOOSE FROM**. This will set the amount of stimulation the pet will receive in the first signal field.

The **RANGE CONTROL** adjuster is recessed to prevent unwanted tampering. The field range can be easily adjusted by using a small screwdriver.

The **TERMINAL BLOCK** is where the loop wires and ground wire are attached to the T-4 transmitter. It is labeled for easy wire identification.
